- Lazy loading is not recommended. But when I click load, nothing happens. I've also tried to use d3dmgame.dll as a exe, then I found the problem is not Lazy loading. A: I managed to solve the problem. You just need to set the path for the d3dmgame.dll file to the same path of your program (C:\Program Files (x86)\NVIDIA Corporation\NVIDIA GPU Computing Toolkit\CUDA\v7.5\bin\x64) and then change all the paths in you program to this file. The error is always due to the version of the DLL. When you use Lazy loading, the DLL is created when you start the program, so when you change the path of the DLL to the same path of your program, the DLL is already used. I had the same issue when compiling my own application. I solved by copying the d3dmgame.dll from the SDK's folder to the application folder For windows 10 the folder is: C:\Program Files (x86)\NVIDIA Corporation\NVIDIA GPU Computing Toolkit\CUDA\v7.5\bin\x64 There are two parts to this question. 1) Why is lazy-loading not recommended and 2) Can I force lazy loading to load? 1) It is generally not recommended. There are a few reasons, one is that the DLL may be changed at any time. A second is that your assembly may be signed differently. You might also have the NGEN flag (which is what lazy-loading turns on) disabled in the build settings. 2) Yes you can. You will need to insert a call to LoadLazy to force the DLL to load at runtime. This is done in a few different ways depending on the platform and version of the .NET framework you are targeting. If you are targeting .NET 4.7 or lower, you can use the full path of the DLL in the LoadLazy call. If you are targeting .NET 4.8, you can use the Assembly.LoadFrom overload that takes a path. If you are targeting .NET Core, you can use the Assembly.LoadFrom overload that takes a path and a ifPresent parameter. If you are targeting .NET Standard 2.0 or higher 82157476af
